

Armed

Aaron Xiong, Ali Mothana, Jenny Nam
[aaaronx, amothana, namjenny]@umich.edu

Our Objective

- Bad at aiming? Heard of auto-aim cheats in video games? We want to bring that to real life!
- Our embedded system provides aim assist so that you will never miss your target again!

Our Idea

- Use IR cameras to detect the target
- Use LEDs, Buzzers, and Haptic Motors to provide aiming guidance
- Utilize an accelerometer on target to detect whether the projectile hits the target

Our Core Functionalities

• Computer Vision

- Wii-IR Camera & a target board to determine the direction of the “blaster”

• Target Board

- 4 equidistant IR LEDs for spatial localization
- An accelerometer-driven microprocessor that lights up the LEDs on the board on impact

• Blaster

- 3d printed piece to hold all components
- Wii-IR camera to detect and analyze target
- Directional aim support with LEDs

- Audio feedback depending on accuracy
- Buttons to toggle buzzer, haptics, and laser
- XBee wireless communication to the Haptics on the arm

• Haptics (Armed)

- Remote controlled haptics
- Vibration upon successfully aiming the center of target
